## DBMS Project Abstract:-

Title:- Flight Reservation System.

Aim:- To develop a database management system for a flight reservation system using SQL.

## Abstract:-

Airline reservation system is a computerized system used to store and retrieve information and conduct transactions related to air travel.

It contains details about flight schedules and their fare tariffs, passenger reservations and ticket records. An airline's inventory contains all flights with their available seats.

It's furthermore divided into 3 categories/classes, i.e., first, business or economy.

Inventory data is imported and maintained through a schedule distribution system.

The project is therefore aimed at developing a system to help passengers ~~book~~ travel and book the airline / seats according to their convenience, i.e., time and affordability, i.e. fare of their respective classes, or even cancel or reschedule them.
